SITE: Interstate Pollution ControlLOCATION: Rockford, Illinois

BACKGROUND/WORK REQUIRED: The Interstate Pollution Control facility is a four acre waste storage facility which accepted a variety of industrial wastes from 1974-1982. Groundwater sampling conducted by the FIT in 1985 indicated VOC, metal, and cyanide contamination. Soil sampling conducted by the TAT in 1988 also revealed that elevated concentrations of metals, cyanide, and organics were present in surface soils. ATSDR studied the metal and cyanide data in 1988 and reported that the site posed no immediate threats to human health and the environment. A site assessment by the TAT in October 1989 found stained surface soils, evidence of recent dumping, and an 100,000 gallon storage tank (reportedly empty) exist at the site. Samples taken from a capped lagoon on site indicated elevated cyanide levels. The lagoon cover is deteriorating.

Access to the site remains unrestricted, and removal of 5 underground storage tanks containing flammable liquids, installation of a temporary clay or synthetic cap, and installation of a perimeter fence are recommended emergency actions.

Enforcement and emergency actions are being coordinated with the Illinois EPA. IPC is a state lead remedial site.
